The image on the front cover depicts a carbon nanotube emerging from a glowing plasma of hydrogen and carbon, as it forms around particles of a metal catalyst. Carbon nanotubes are a recently discovered allotrope of carbon. Three other allotropes of carbon-buckyballs, graphite, and diamond-are illustrated at the left, as is the molecule methane, CH₄, from which nanotubes and buckyballs can be made. The element carbon forms an amazing number of compounds with structures that follow from simple methane, found in natural gas, to the complex macromolecules that serve as the basis of life on our planet. The study of chemistry also follows from the simple to the more complex, and the strength of this text is that it enables students with varied backgrounds to proceed together to significant levels of achievement.

This Third Edition of the widely-used fundamentals textbook for science majors maintains the conversational writing style that made the previous editions so popular, while including up-to-date treatments of important and current topics. Emphasizes descriptive chemistry--chemical reactions and properties--while maintaining a solid treatment of chemical principles. Common chemicals are used, whenever possible, as examples in both theoretical discussions and in problems and exercises. Incorporates many pedagogical aids: each chapter begins with a brief table of contents, and each section begins with a preview of topics covered. Chapters include frequent margin comments, figures, and photographs.
