Correlations, Overview, and Chapter Summary.

This book is a concise but comprehensive text for review and self evaluation in the study of the microscopic anatomy of the major organ systems of the body. It aims to meet the requirements of students of Medicine, Dentistry, Histopathology, Mammalian Biology and the Paramedical Sciences. The subjects have been chosen to complement a program of physiology and dissection or prosection. Basic concepts of cell and tissue biology are presently considered in separate prerequisite units integrated with biochemistry and genetics and are not included in this text. The approach has been to focus on unique features or diagnostic differences between cells, their function and organisation into organs rather than on pure morphologic description. Developmental aspects of certain organs have been described where these contribute to understanding functional relationships between cells in organ systems. A uniform text structure (point form) helps the reader to organise, review and retain pertinent information. A summary precedes each chapter which helps to focus on key concepts. Each topic is also prefaced by a list of objectives which serve as a guide for review. In addition, a list of key words (bold in the text), phrases and concepts that should be defined as a result of reading the text. The terminology follows that in contemporary use giving alternative names according to Nomina Histological where possible. A series of plates illustrates in line drawings the major features of cells in organs based on electron micrographs. In addition, tables show functional relationships between cells or their products.

Medical terminology, also known as med terms, is the language of health care. The language is used to precisely define the human body, it's functions and processes, and the procedures used in medicine. In this book, you will learn: -CHAPTER 1: Basic Word Elements -CHAPTER

Human Form, Human Function is the first essentials level text that seamlessly weaves together form (anatomy) with function (physiology), an approach that caters to how instructors teach and students learn. Authors Tom McConnell and Kerry Hull incorporate real-life case studies as the vehicle for learning how form and function are linked. Through careful organization, thoughtful presentation, and a conversational narrative, the authors have maintained a sharp focus on communication: between body organs and body systems, between artwork and student learning, between content and student comprehension. Each feature reinforces critical thinking and connects anatomy and physiology to the world of health care practice. This original text offers an exceptional student learning experience: an accessible and casual narrative style, dynamic artwork, and a complete suite of ancillaries help build a solid foundation and spark students' enthusiasm for learning the human body.

This unique book deals with both inflammation and cancer in a single source of publication. They are seldom grouped together although it has been known that both diseases are closely associated, particularly in the gastrointestinal tract and liver. As the book touches on two such major areas of diseases in humans, it should be of interest to a wider audience of researchers and readers. It is noted that the book combines the effort of both basic scientists and clinicians from different countries with extensive experiences in molecular biology and clinical practice to unveil the most updated picture of the pathogenesis and therapeutic strategies in the treatment of inflammation and cancer in the digestive tract. In this regard, potential pathogenic modulators and also therapeutic options are widely discussed. These types of information would definitely broaden our knowledge in better understanding these diseases.
