

Classifying Sharks Using Dichotomous Key Answers

This guide was developed with the intention of helping teachers and school site administrators in California review the elementary science curriculum and compare it to an idealized model that is presented in the document. Part I of the guide provides a summary of a number of characteristics considered to be important to a strong elementary science program. It was designed to aid teachers, principals, and parents in identifying features of their local science program where attention is needed. Part II presents a full-scale portrait of an elementary science program that focuses on the development of student understanding. This section presents teaching ideas that are concerned with both the knowledge base and science process skills. Common themes are present in the discussion of science instruction in the various subject areas. The disciplines and associated themes addressed are: (1) biological science (cells, genetics, evolution, plants, protists, animals, human beings, ecosystems); (2) earth science (astronomy, geology and natural resources, meteorology, oceanography and hydrology); and (3) physical science (matter, mechanics, energy sources and

This book traces the discovery of Australia's fishes from the earliest days of taxonomy to the first part of the 20th century. It provides a unique insight into the diverse pathways by which Australia's fish were discovered and outlines the history of early maritime explorations in Australia that collected natural history specimens. The book covers the life and work of each of the most important discoverers, and assesses their accomplishments and the limitations of their work. Discovery of Australia's Fishes is distinctive in that a biographic approach is integrated with chronological descriptions of the discovery of the Australian fish fauna. Many of northern Australia's fishes are found in parts of the Indian and western Pacific oceans. The book covers the work of collectors who travelled outside Australia, together with that of the British and European zoologists who received and described their collections. The account ceases at 1930, the year

Members of the monofamilial chondrichthyan order Squatiniformes, commonly known as angel sharks, sand devils, ange de mer, and angelotes, are primarily benthic dwelling sharks found mainly in temperate and sub-tropical parts of the Atlantic and Pacific Oceans. Squatiniformes are very easily recognized from other shark-like fishes, but the individual species within the order are much more difficult to distinguish from each other. In the eastern North Pacific (ENP) region, three species descriptions were published from 1859 to 1913. Since the latter date, the systematics of the entire order of Squatiniformes has been in a state of flux, from having only one description recognized as valid to having all three being recognized as valid at different points in history. Currently only two descriptions are considered valid *Squatina californica*, Ayers, 1859 and *Squatina*

armata (Philippi, 1887). Herein, the presence of at least four phenotypic morphs in the ENP is confirmed and a revised dichotomous key for the Squatiniformes of the region is presented. Additionally, numerous mistakes in the classification and cataloging of museum specimens are noted and corrected.

Volume 2: This is the second volume of an extensively rewritten, revised, and updated version of the original FAO Catalogue of Sharks of the World. The present volume reviews all 15 families 25 genera and 57 species of living bullhead, mackerel and carpet sharks (orders Heterodontiformes, Lamniformes and Orectolobiformes), that is, the non-carcharhinoid galeomorph sharks, including certain well-established but currently undescribed species mainly from Australia. It gives accounts for all orders, families and genera and all keys to taxa are fully illustrated. Information under each species account includes: valid modern names and original citation of the species (or subspecies); synonyms; the English, French, and Spanish FAO Names for the species; a lateral view and often other useful illustrations; field marks; diagnostic features; distribution, including a GIS map; habitat; biology; size; interest to fisheries and human impact; local names when available; a remarks section when necessary; and literature. The volume is fully indexed and also includes sections on terminology and measurements including an extensive glossary, a list of species by FAO

Exploring Biology in the Laboratory: Core Concepts is a comprehensive manual appropriate for introductory biology lab courses. This edition is designed for courses populated by nonmajors or for majors courses where abbreviated coverage is desired. Based on the two-semester version of Exploring Biology in the Laboratory, 3e, this Core Concepts edition features a streamlined set of clearly written activities with abbreviated coverage of the biodiversity of life. These exercises emphasize the unity of all living things and the evolutionary forces that have resulted in, and continue to act on, the diversity that we see around us today.

Our world is incredibly diverse, but why are living things so different, and how do we make sense of the vast range of life forms? This book tackles the issues of variation - how and why it occurs - and classification, looking at how we organise plants and animals into groups.
