Methods of collecting, classifying and interpreting data on human performance lie at the very root of ergonomics, and these methods are collectively know as "task analysis". They mirror both our current understanding of human performance and the design of systems which best serve the needs of their users. The concepts and techniques of task analysis have changed dramatically in recent years, and this collection serves to provide a summary of current research and advanced practice. It consists of eleven chapters written by distinguished practitioners in the field, ranging in scope from classical ergonomics to cognitive psychology, software engineering and systems design. This book is a production of a 1998 special issue of the journal *Ergonomics*, with a new introduction from the editors.
