IQ testing works on the assumption that we are all born with an inherited intelligence - a fixed quantity that cannot be increased. However there are different types of intelligence, such as creativity, logic, lateral thinking, memory and personality (EQ/Emotional Intelligence) that are equally or more important than IQ. Test and Assess Your Brain Quotient helps you to assess these different types of intelligence. It consists of numerous tests and assessments which examine your agility of mind, powers of logical analysis, numerical, verbal and spatial aptitudes, memory and personality. The results of the tests are then collated into a final section, providing an overall rating or Brain Quotient (BQ). The brain quotient reveals your strengths, such as connecting with people emotionally and your weaknesses, such as a poor memory, helping you to identify your true potential for achievement. It will help you to build and capitalise on these strengths while improving your performance in areas of weakness. Test and Assess Your Brain Quotient will help you to exploit your enormous brain potential, increase its performance and enhance quickness of thought. Whether you want to find out how clever you really are, or you just wish to stretch your mind for your own entertainment, this is a fascinating, challenging book.

Natural language generation (NLG) is a subfield of natural language processing (NLP) that is often characterized as the study of automatically converting non-linguistic representations (e.g., from databases or other knowledge sources) into coherent natural language text. In recent years the field has evolved substantially. Perhaps the most important new development is the current emphasis on data-oriented methods and empirical evaluation. Progress in related areas such as machine translation, dialogue system design and automatic text summarization and the resulting awareness of the importance of language generation, the increasing availability of suitable corpora in recent years, and the organization of shared tasks for NLG, where different teams of researchers develop and evaluate their algorithms on a shared, held out data set have had a considerable impact on the field, and this book offers the first comprehensive overview of recent empirically oriented NLG research.

Critics often warn that American schools are failing, and that our students are ill-prepared for the challenges the future holds, and may even be "the dumbest generation." We can think of these claims as warning about a Stupidity Epidemic. This essay begins by tracing the history of the idea of that American students, teachers, and schools are somehow getting worse; the record shows that critics have been issuing such warnings for more than 150 years. It then examines four sets of data that speak to whether educational deterioration is taking place. First, data on educational attainment show a clear trend: more students are getting more education. Second, standardized test scores suggest that American students are performing somewhat better; certainly most test scores do not indicate that students are getting worse. Third, measures of popular knowledge also show evidence of improvement. Fourth, there is clear evidence that IQ scores have been rising. In other words, the best available evidence fails to support claims about a Stupidity Epidemic. The essay then turns to exploring several reasons why belief in educational decline is so common, and concludes by suggesting some more useful ways to think about educational problems. The goal of this new, unique Series is to offer readable, teachable "thinking frames" on today's social problems and social issues by leading scholars, all in short 60 page or shorter formats, and available for view on
