The management of construction projects is a wide ranging and challenging discipline in an increasingly international industry, facing continual challenges and demands for improvements in safety, in quality and cost control, and in the avoidance of contractual disputes. Construction Management grew out of a Leonardo da Vinci project to develop a series of Common Learning Outcomes for European Managers in Construction. Financed by the European Union, the project aimed to develop a library of basic materials for developing construction management skills for use in a pan-European context. Focused exclusively on the management of the construction phase of a building project from the contractor's point of view, Construction Management covers the complete range of topics of which mastery is required by the construction management professional for the effective delivery of new construction projects. With the continued internationalisation of the construction industry, Construction Management will be required reading for undergraduate and postgraduate students across Europe.

Corporate decisions have consequences, especially if they pertain to a company's strategic advancement. These decisions are almost always implemented using an organizational development project. Understandably, members of the senior management and project management prefer to make the process as predictable and tangible as possible. Frequently, they rely on resource planning for (a subjective sense of) certainty. However, it can be generally observed that traditional resource planning is an insufficient solution for organizational development projects. Quotes like the following illustrate how fancifully it is implemented and utilized: "105 percent of the time, my employees are working at 200 percent of their capacity." The present thesis not only provides an overview of existing approaches, their potentials and limitations, but also shows how adequate resource planning can be productively implemented.
