Over the past years, psychiatric services have been continuously faced with the challenge of providing comprehensive care to people suffering from severe mental illnesses. Legal and conceptual advances like the UN convention on the rights of persons with disabilities or the concept of recovery have rendered this challenge more actual and urgent than ever. However, psychiatric institutions often show only low levels of cooperation and integration between their different services. Hence, they need to develop new ways of bridging all sectors of care in order to help people most in need on their way to recovery and full inclusion in society. In this research topic, European researchers and clinicians present new ways of dealing with this essential issue by developing strategies and interventions on both institutional and non-institutional levels. The nine contributions of this ebook thus reflect actual clinical and conceptual considerations. They all aim at improving quality of care and providing adequate support to people suffering from severe mental illness.

Janine Frauendorf analyzes how customer processes can be used to optimize the overall service process. She presents significant implications for services research and helpful suggestions for business practice.

Disability evaluations are the most common clinical mental health evaluations conducted for nontreatment purposes. They place mental health professionals in the role of communicating information that is typically confidential to administrative and legal systems. Unfortunately, mental health professionals receive little to no training in conducting assessments that focus on disability and disability management, and often do not understand the implications and risks of providing this information, especially without conducting what are often specialized evaluations. Clinical Guide to Mental Health Disability Evaluations is geared for general mental health practitioners, providing them with the basic information needed to competently provide the various types of disability evaluations. It also provides enough information to inform forensic mental health providers in conducting more specialized evaluations.

Early Reading Instruction is a comprehensive analysis of the research evidence from early writing systems to computer models of reading. In this book, Diane McGuinness provides an innovative solution to the "reading war"—the century-old debate over the efficacy of phonics (sound-based) versus whole-word (meaning-based) methods. She has developed a prototype—a set of elements that are critical to the success of a reading method. McGuinness shows that all writing systems, without exception, are based on a sound unit in the language. This fact, and other findings by paleographers, provides a platform for the prototype. Other elements of the prototype are based on modern research. For example, observational studies in the classroom show that time spent on three activities strongly predicts reading success: learning phoneme/symbol correspondences, practice at blending and segmenting phonemes in words, and copying/writing words, phrases, and sentences. Most so-called literacy activities have no effect, and some, like sight word memorization, have a strongly negative effect. The National Reading Panel (2000) summarized the research on reading methods after screening out thousands of studies that failed to meet minimum scientific standards. In an in-depth analysis of this evidence, McGuinness shows that the most successful methods (children reading a year or more above age norms) include all the elements in the prototype. Finally, she argues, because phonics-type methods are consistently shown to be superior to whole-word methods in studies dating back to the 1960s, it makes no sense to continue this line of research. The most urgent question for future research is how to get the most effective phonics programs into the classroom.

Increased public awareness of traumatic brain injuries has fueled a number of significant developments: on the one hand, more funding and more research related to these injuries and their resulting deficits; on the other, the possibility of higher stakes in personal injury suits—and more reasons for individuals to feign injury. Expanding both the conceptual and clinical knowledge base on the subject, the Second Edition of *Detection of Malingering during Head Injury Litigation* offers the latest detection tools and techniques for veteran and novice alike. As in its initial incarnation, this practical revision demonstrates how to combine clinical expertise, carefully-gathered data, and the use of actuarial models as well as common sense in making sound evaluations and reducing ambiguous results. And, the book navigates the reader through the many caveats that come with the job, beginning with the scenario that an individual may be malingering despite having an actual brain injury. Among the updated features:

- Specific chapters on malingering on the Halstead-Reitan, Luria-Nebraska, and MMPI-2.
- A framework for distinguishing genuine from factitious PTSD in head injury cases.
- Detailed information regarding performance on the WMT, MSVT, and NV-MSVT by children with developmental disabilities.
- Guidelines for explaining symptom validity testing to the trier of fact.
- Entirely new chapters on mild TBI and on malingering of PTSD symptoms in the context of TBI litigation.

Professional neuropsychologists and forensic psychologists will appreciate this new edition of *Detection of Malingering during Head Injury Litigation* as an invaluable source of refinements to their craft, and improvement as an expert witness.
